1. Introduction

This chapter describes the basic concept and structure of JEUS SNMP. This chapter describes the relationship between the JEUS SNMP agent and the JEUS system and the relationship between JEUS SNMP agent and the JEUS JMX . This chapter also describes an SNMP manager application that exchanges messages with the SNMP agent.

1.1. Overview

SNMP stands for Simple Network Management Protocol. It is a standard protocol to monitor hardware and software in the network. The JMX 1.2 specifications provide protocol adapter that supports SNMP. The Jakarta Management 1.1 specification defines a Management Information Base (MIB) that is used by the network or system management protocols for Internet communications.

1.2. Components

The main components for the JEUS SNMP agent are as follows:

- **JEUS SNMP Agent**

Communicates with the JMX Mbean server and logically resides in JEUS. JEUS SNMP agent provides base structure to manage JEUS and implements Jakarta Management 1.1. For more information about JEUS server structure, refer to "JEUS Server Guide".

Provides the JEUS management information structure. The MIB file name is TMAX-JEUS-9.0-MIB.mib.

- **SNMP Manager**

Exchanges messages with the SNMP agent.

When the SNMP Manager application sends SNMP messages, the SNMP agent listens to the specified port. If a request comes through the port, the SNMP agent finds the OID in the MIB-tree to find the protocol data unit (hereafter PDU) type, and calls the JEUS JMX MBean server. When the SNMP agent receives the desired information, it returns the value to the SNMP Manager application.

SNMP Agent

The JEUS SNMP Agent module is a useful component to monitor the JEUS management system through SNMP.

As a management protocol for web application server, the JEUS SNMP agent communicates with the JEUS JMX MBean server and supports the SNMP Manager application.

The JEUS SNMP agent supports the following protocols.

- SNMPv1
- SNMPv2
- SNMPv3

The JEUS SNMP agent operates based on the JEUS JMX. The JEUS SNMP agent uses the JEUS JMX API to retrieve information. The SNMP agent uses the JEUS JMX API as the second-level service component of the JEUS management system, and each JEUS SNMP agent is related to one of the JVMs like a server in the JEUS system.

For example, the JMX Mbean manages the information about all modules that are deployed on the EJB engine. The SNMP Manager sends the information (JEUS SNMP OID) to the SNMP agent of an EJB engine to retrieve information about the deployed modules.

The SNMP agent instance runs as a protocol adapter for JEUS JMX and handles SNMP packets received from SNMP Manager applications. The SNMP agent also listens on the specified port for SNMP Manager requests. If the port is not specified, the SNMP agent does not run.

All agent instances work in the same way. Therefore, each agent can retrieve all information concerning JEUS management system. In order to run more than one agent instance on the same machine, the port numbers should be different.

To run the JEUS SNMP agent, the SNMP adapter port must be set.

SNMP Manager Application

The SNMP Manager is an application that manages a specific system, especially one that manages communication tools. In Jakarta EE, the SNMP Manager manages enterprise applications, especially middleware like Web Application Server (WAS).

The SNMP Manager application sends management information request to the SNMP agent, with references to MIB. The application parses the MIB file to analyze the structure of the information and makes it easier for the Manager to read and manage the information.

2. SNMP Agent

This chapter describes about environment configurations of the JEUS SNMP agent.

2.1. Overview

JEUS SNMP agents have characteristics of J2EE components as well as that of the enterprise message-oriented middleware.

- Fully supports the Jakarta management 1.1 specifications.
- Supports SNMPv1 and SNMPv2, which are commonly used as NMS protocols.

All SNMP Managers that use SNMPv1 and SNMPv2 can retrieve internal information from JEUS through the agent.

- Provides SNMPv3 for secure communication with SNMP agents.

SNMP Manager is required to securely communicate with SNMP agents. All SNMP Managers that use SNMPv3 can securely retrieve information.

- JEUS SNMP agents can be executed on each of their corresponding JEUS JVM (server).

2.2. Configuring the SNMP Adapter

The following explains how to configure an SNMP agent using the JEUS configuration file (domain.xml).

```
<server>
...
  <jmx-manager>
    ...
    <snmp-adaptor>
      <snmp-adaptor-port>8099</snmp-adaptor-port>
      <snmp-version>3</snmp-version>
      <snmp-max-packet-size>256</snmp-max-packet-size>
      <trap-demon>
        <ip-address>127.0.0.1</ip-address>
        <port>9099</port>
      </trap-demon>
      <pooling>
        <min>1</min>
        <max>5</max>
        <period>30000</period>
      </pooling>
    </snmp-adaptor>
    ...
  </jmx-manager>
  ...
</server>
```

The following describes each item.

Item	Description
Snmp Adaptor Port	Listener port of the SNMP adapter. SNMP Manager can request management information through this port.
Snmp Version	SNMP version. 1, 2, or 3 can be used.
Snmp Max Packet Size	Maximum SNMP packet size. The minimum size is 256 bytes.
Snmp Security	Indicates whether to enable SNMP security. Security can only be specified in SNMPv3.
Trap Demon	Server to send TRAP messages to after an error occurs. Multiple addresses can be used. Messages will be sent to all specified IP addresses.
Pooling	If requests arrive for SNMP agent simultaneously, a thread pool can be used. <ul style="list-style-type: none">◦ Min, Max: The minimum & the maximum number of worker threads.◦ Period: Worker thread check interval.

The thread pool configuration is shared by various JEUS components. For more information, refer to relevant guides.

3. SNMP MIB

This chapter describes the SNMP MIB.

3.1. Overview

You can access all JEUS server attributes, which are defined in JEUS MIB. The MIB is a part of the standard SNMP.

Refer to www.ietf.org for information about MIB.

3.2. Browsing the MIB

The JEUS MIB file is defined in the file, TMAX-JEUS9.0-MIB.mib, in the following directory.

```
JEUS_HOME/lib/system
```

You can open the MIB file directly, and check the OID attribute mapping information in [JEUS SNMP MIB Information](#).

Third party MIB browsers can be used. JEUS does not provide a MIB browser, but most of SNMP utility vendors provide one.

3.3. Object Identifier (OID)

Object ID (OID) is a sequence of integers that uniquely identifies a managed object and defines the path to the object using the OID tree. The OID is defined in the MIB file.

Each OID is mapped to each attribute of the JEUS Mbean. To get information on a particular OID, send a SNMP packet with the OID value to the JEUS SNMP agent.

The following is the JEUS MIB OID tree.

JEUS MIB OID

TmaxSoft Enterprise OID is 1.3.6.1.4.1.14586 so the prefix of all JEUS attributes is 1.3.6.1.4.1.14586.100. For example, the OID of the server version attribute of the JEUS Manager is 1.3.6.1.4.1.14586.100.3.2.

3.4. JEUS SNMP OID Suffix

The following is standard suffixes for retrieving an object array.

Suffix	Description
0	Gets all objects.
1	Gets the first object among all the objects.

For example, in the OID 1.3.6.1.4.1.14586.100.9.1.1, 1.3.6.1.4.1.14586.100.9.1 refers to EJB module object name attribute, and 1.3.6.1.4.1.14586.100.9.1.1 refers to the first EJB module object name. Therefore, GET_NEXT 1.3.6.1.4.1.14586.100.9.1 returns the value 1.3.6.1.4.1.14586.100.9.2 instead of 1.3.6.1.4.1.14586.100.9.1.1.

The JEUS SNMP agent provides a special OID suffix "9999" to retrieve the total number of objects. For

example, GET 1.3.6.1.4.1.14586.100.9.1.9999 will return 10 if 10 EJB modules are deployed on JEUS.

Not all trees have a suffix, so only the actual OID can be searched.

3.5. Static OID and Dynamic OID

JEUS supports two kinds of OIDs.

- **Static OID**

- The static OID is made up of only MIB-based information.
- Objects that have the same characteristics have the same OID. If multiple objects have the same OID, their values are returned in a list.

For example, when two web containers operate in JEUS, if an OID that corresponds to the container names is requested, a list of values, such as [server name1, server name2], is returned.

- It is not easy to monitor an object if multiple objects have the same OID.

- **Dynamic OID**

- Dynamic OID made by appending 32 numbers separated by "." to MIB-based OID value in order to allocate a unique OID to an object (Example: [MIB-based OID].1.2.3.4.5---.31.32).
- Dynamic OID made by appending 32 numbers separated by "." to MIB-based OID value in order to allocate a unique OID to an object (Example: [MIB-based OID].1.2.3.4.5---.31.32).
- The SNMP agent dynamically creates a 32-digit OID when an object is created. It is easy to monitor a specific object because each object has a dynamic OID.

The following shows the difference of using static OID and dynamic OID for getting the maximum and minimum values of the thread pool of each container, when two containers operate in JEUS.

- Using Static OID

A list of objects that correspond to the MIB based OID is returned.

```
[OID for maximum value]=[ maximum, maximum' ], [OID for minimum value]=[ minimum, minimum' ]
```

In the returned list, it is not possible to tell whether the maximum and minimum values in the same position are values from the same container. A value from one container can be placed in the first or second positions.

- Using Dynamic OID

The result is displayed as follows. It provides the exact values for each object.

```
[OID for maximum value].[Dynamic OID of server1]=maximum, [OID for minimum value].[Dynamic OID of
```

```
server1]=minimum
```

In JEUS, SNMP uses the dynamic OID by default. In order to use the static OID, execute the following through the JEUS execution script.

```
-Djeus.management.snmp.dynamic=false
```

4. SNMP Manager Application

This chapter describes how to develop JEUS SNMP Manager applications and how to configure them.

4.1. Overview

SNMP Managers that conforms to the SNMP (SNMPv1, SNMPv2, and SNMPv3) standard can be integrated with JEUS SNMP.

For more information about SNMP, refer to the SNMP Management Framework related specification (Jakarta management 1.1 specification).

4.2. SNMP Client Program Sample

Application types vary depending on the occasion. This section shows a client program that uses the SNMP4J API.

SNMP4J is an open source API and provides SNMP implementation classes for J2SE 1.4 or higher. The SNMP client application, that uses SNMP4J API, must perform the following steps.

1. Set the SNMP object OID and the PDU type.
2. Set the address and port number of the target, where SNMP information will be retrieved from, and set the SNMP version. Since JEUS SNMP uses UDP, use the UDPAddress.
3. Create an SNMP message object and then a message to send.
4. Send a message and receive a response.

Example

The following is a SNMP client application program example that uses the SNMP4J API.

SNMP Client Application: <SnmclientSample.java>

```
import java.net.*;
import java.util.*;
import org.snmp4j.*;
import org.snmp4j.PDU;
import org.snmp4j.mp.SnmpConstants;
import org.snmp4j.event.ResponseEvent;
import org.snmp4j.transport.*;
import org.snmp4j.smi.*;

public class SnmclientSample{
    static int defaultPort = 9999;
    static String defaultIP = "127.0.0.1";
    static String defaultOID = "1.3.6.1.4.1.14586.100.2.1";
```

```

static void testGetNext(String oid) throws java.io.IOException {
    //1. Make Protocol Data Unit
    PDU pdu = new PDU();
    pdu.add(new VariableBinding(new OID(defaultOID)));
    pdu.setType(PDU.GETNEXT);

    //2. Make target
    CommunityTarget target = new CommunityTarget();
    UdpAddress targetAddress = new UdpAddress();
    targetAddress.setInetAddress(InetAddress.getByName(defaultIP));
    targetAddress.setPort(defaultPort);
    target.setAddress(targetAddress);
    target.setCommunity(new OctetString("public"));
    target.setVersion(SnmpConstants.version1);

    //3. Make SNMP Message. Simple!
    Snmp snmp = new Snmp(new DefaultUdpTransportMapping());

    //4. Send Message and Recieve Response
    snmp.listen();
    ResponseEvent response = snmp.send(pdu, target);
    if (response.getResponse() == null) {
        System.out.println("Error: There is some problems.");
    } else {
        Vector variableBindings = response.getResponse().getVariableBindings();
        for( int i = 0; i < variableBindings.size(); i++){
            System.out.println(variableBindings.get(i));
        }
    }
    snmp.close();
}

public static void main(String[] args) throws java.io.IOException {
    // get the SNMP port number
    if (args.length > 0) {
        defaultPort = Integer.parseInt (args[0]);
    }
    System.out.println ("PORT : " + defaultPort);

    // get the ip address of the machine that the SNMP agent runs on
    if (args.length > 1) {
        defaultIP = args[1];
    }
    System.out.println ("IP : " + defaultIP);

    // get the OID number that you want to get the value of
    if (args.length > 2) {
        defaultOID = args[2];
    }
    System.out.println ("OID : " + defaultOID);
    try {
        testGetNext(defaultOID);
    } catch (Exception ex) {
        System.out.println ("ex *** : " + ex);
        ex.printStackTrace ();
    }
}
}

```

Refer to [SNMP4j Official Documentation](#) for information about SNMP4j API.

5. SNMP Example

This chapter describes how to start JEUS SNMP agent and how the SNMP client application retrieves monitoring information from JEUS.

1. Modify the SNMP client example program in [SNMP Client Program Sample](#) and compile it. In order to compile the example program, SNMP4j is required. You can download the SNMP4j API at www.snmp4j.org.
2. Refer to [Configuring the SNMP Adapter](#) in [SNMP Agent](#) to configure the SNMP Adaptor. The example uses port 9999, so set the SNMP Adapter port to '9999'.
3. Restart the server. If SNMP Adapter is in use, the following log appears.

```
. . .  
[2016.08.03 16:32:12][0] [adminServer-1] [SNMP-0004] The SNMP agent is ready using the port 9999.  
. . .
```

This example assumes the JEUS server name as 'adminServer'.

4. Execute the example program created in step 1. Set the classpath to SNMP4j in order to run the program. This example assumes that SNMP4j is the file 'SNMP4j.jar' under the '/home/user1/lib' directory.

```
$ java -classpath /home/user1/lib/SNMP4J.jar SnpclientSample  
PORT : 9999  
IP : 127.0.0.1  
OID : 1.3.6.1.4.1.14586.100.2.1  
1.3.6.1.4.1.14586.100.2.1.0 = [JEUS:JMXManager=adminServer,j2eeType=J2EEDomain,name=domain1]
```

This program is set to access the port number, 127.0.0.1:9999. In order to access a different address and port, provide parameter values for the port number and IP address when executing the program.

Appendix A: JEUS SNMP MIB Information

This appendix describes the JEUS SNMP MIB in detail.

A.1. Overview

The developers for SNMP Manager need the MIB file as a reference. The JEUS MIB file, TMAX-JEUS9.0-MIB.mib, is located in the following directory.

```
JEUS_HOME/lib/system
```

This file can be used to check the mapping of JEUS SNMP MIB file contents and their attribute values and the mapping of OIDs.

A.2. Mapping OID to Attributes

For better understanding of TMAX-JEUS-MIB, this section provides a simple table of OIDs and attributes.

The mapping format is as follows:

```
[OID(group name)] [attribute(attribute name)]
```

The common prefix "1.3.6.1.4.1.14586.100." for all OIDs is omitted. (TmaxSoft Enterprise Id is 14586 and JEUS product Id is 100).

The difference in the mapping format, from JEUS 4.x version, is that **[OID(Group Name)]** is placed before **[Attribute(Attribute Name)]**. This is to prevent creating a duplicate MIB object name.

The following is a table of OIDs and attributes.

```
2.1 j2EEDomainobjectName
2.2 j2EEDomainservers
3.1 j2EEServerobjectName
3.2 j2EEServerserverVersion
3.3 j2EEServerserverVendor
3.4 j2EEServerjavaVMs
3.5 j2EEServerdeployedObjects
3.6 j2EEServerresources
3.8 j2EEServerjeusServices
3.9 j2EEServerengines
